## Cross-section measurements and search for vector states at cms energies 4-5 GeV

*Tuesday 18 July 2023 14:20 (20 minutes)*

In recent years, BESIII has accumulated tens of 1/fb electron-positron colliding data samples at cms energies from 4 to 5 GeV. Cross-section measurements are performed with specific final states to search for vector charmonium(-like) states. I shall present three corresponding recent results in this talk. It includes: 1) cross-sections of  $e^+ e^- \rightarrow K_S K_S J/\psi$  from 4.13 to 4.95 GeV, in which  $Y(4230)$  is observed and there is an evidence of a new vector charmonium-like state  $Y(4710)$ ; 2) cross-sections of  $e^+ e^- \rightarrow D^0 D^+ \pi^-$  from 4.19 to 4.95 GeV, where three enhancements around 4.20, 4.47 and 4.67 GeV has been observed; 3) helicity amplitude analysis of  $e^+ e^- \rightarrow \pi^+ \pi^- \omega$  has been performed from 4.0 to 4.6 GeV, Born cross-sections of two body intermediate states have been presented and an evidence of a resonance state around 4.2 GeV is found.
