Radiative corrections to $B \rightarrow \ell\nu$

Tuesday 1 October 2024 15:50 (20 minutes)

In this talk I will focus on the study of the leptonic $B \rightarrow \ell\nu$ decay at next-to-leading order in QED. The future improvements of experimental measurements of this channel require a reliable theory prediction, hence a careful theoretical estimate of QED corrections. The multi-scale character of this process requires an appropriate effective theory (EFT) construction to factorize the different contributions. In the first part of this talk, I will discuss the EFT description of the process at the partonic level, which is based on Heavy Quark Effective Theory and Soft Collinear Effective Theory. I will show how the inclusion of QED corrections demands a generalisation of the hadronic decay constant defining a new non-perturbative input. In the second part of the talk, I will discuss the EFT description below the confinement scale based on the Chiral Lagrangian including Heavy Mesons (B and B*). I will show that depending on the cut on final state radiation and on the lepton flavor the contribution from excited states of the B meson can become important.
