\*Not co-authors of the talk

## ► Very rare processes

- Flavour Changing Neutral Current
  - No tree-level diagram in the Standard Model (SM)
- Loop-, CKM- & helicity suppression

► Very rare processes

► **Precise theory predictions** [\[JHEP 10 \(2019\), 232\]](#)

(purely leptonic final state)

$$\rightarrow \mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-)_{\text{SM}} = (3.66 \pm 0.14) \times 10^{-9}$$

$$\rightarrow \mathcal{B}(B^0 \rightarrow \mu^+ \mu^-)_{\text{SM}} = (1.03 \pm 0.05) \times 10^{-10}$$

# $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ decays

- Very rare processes
- Precise theory predictions
- **Clean experimental signature**

- Very rare processes
- Precise theory predictions
- Clean experimental signature
- **Observables with complementary sensitivity to New Physics (NP)**

→  $\mathcal{B}(B_{(s)}^0 \rightarrow \mu^+ \mu^-)$ :  $\mathcal{C}_{10}^{(\prime)}$ ,  $\mathcal{C}_S^{(\prime)}$ ,  $\mathcal{C}_P^{(\prime)}$

→ Effective lifetime  $\tau_{\mu^+ \mu^-}$

→ Mass-eigenstate rate-asymmetry  $\mathcal{A}_{\Delta\Gamma}$

→ Time dependent  $CP$ -asymmetry  $S_{\mu\mu}$   
(tagged measurement)

[Phys. Rev. Lett. 109 (2012), 041801]

- ▶ Very rare processes
- ▶ Precise theory predictions
- ▶ Clean experimental signature
- ▶ Observables with complementary sensitivity to New Physics (NP)
- ▶ **Sensitive to different NP contributions from...**
  - Leptoquarks [[JHEP 05 \(2017\), 076](#)]
  - $Z'$  bosons [[JHEP 02 \(2013\), 116](#)]
  - Extended Higgs sector [[Phys. B 586 \(2000\) 39](#)]

- ▶ Very rare processes
- ▶ Precise theory predictions
- ▶ Clean experimental signature
- ▶ Observables with complementary sensitivity to New Physics (NP)
- ▶ Sensitive to different NP contributions

→ Great mode to test the SM and search for NP

- ▶ Long history of measurements
- ▶ A lot of competition in the field!
- ▶ First observation of  $B_s^0 \rightarrow \mu^+ \mu^-$  in 2014

[Nature 522 (2015), 68]

→ More precise measurements followed

- ▶ Long history of measurements
- ▶ A lot of competition in the field!
- ▶ First observation of  $B_s^0 \rightarrow \mu^+ \mu^-$  in 2014  
[Nature 522 (2015), 68]

→ More precise measurements followed

- ▶  $\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-)$  and  $\tau_{\mu^+ \mu^-}$  measured to be consistent with SM
- ▶ No evidence for  $B^0 \rightarrow \mu^+ \mu^-$  until now

- ▶ Long history of measurements

- ▶ First observation of  $B_s^0 \rightarrow \mu^+ \mu^-$  in 2014  
[Nature 522 (2015), 68]

→ More precise measurements followed

- ▶  $\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-)$  and  $\tau_{\mu^+ \mu^-}$  measured to be consistent with SM
- ▶ No evidence for  $B^0 \rightarrow \mu^+ \mu^-$  until now

- ▶ Goals of this analysis:

- Increase precision on  $B_s^0 \rightarrow \mu^+ \mu^-$
- Evidence for  $B^0 \rightarrow \mu^+ \mu^-$

► Analysis steps:

**1. Selection**

→ Two-stage Boosted Decision  
Tree (BDT) selection

**2. Corrections** of simulation/data  
differences

**3. Efficiency** calculation

**4. Mass fit** (in bins of the BDT output)

→ **Branching Fraction (BF)** extraction

► Analysis steps:

**1. Selection**

→ Two-stage Boosted Decision Tree (BDT) selection

**2. Corrections** of simulation/data differences

**3. Efficiency** calculation

**4. Mass fit** (in bins of the BDT output)

→ **Branching Fraction (BF)** extraction

## Absolute BF measurement

$$\mathcal{B}_{\text{sig}} = \frac{N_{\text{sig}}}{2 f_q \mathcal{L}_{\text{int}} \sigma_{pp \rightarrow b\bar{b}} \varepsilon_{\text{sig}}}$$

- $N$ : # signal candidates (fit)
- $\varepsilon$ : efficiency
- $\mathcal{L}_{\text{int}}$ : integrated luminosity
- $\sigma_{pp \rightarrow b\bar{b}}$ :  $pp \rightarrow b\bar{b}$  cross section
- $f_q$ : hadronisation fraction

► Analysis steps:

**1. Selection**

→ Two-stage Boosted Decision Tree (BDT) selection

**2. Corrections** of simulation/data differences

**3. Efficiency** calculation

**4. Mass fit** (in bins of the BDT output)

→ **Branching Fraction (BF)** extraction

## Absolute BF measurement

$$\mathcal{B}_{\text{sig}} = \frac{N_{\text{sig}}}{2 f_q \mathcal{L}_{\text{int}} \sigma_{pp \rightarrow b\bar{b}} \varepsilon_{\text{sig}}}$$

►  $N$ : # signal candidates (fit)

►  $\varepsilon$ : efficiency

►  $\mathcal{L}_{\text{int}}$ : integrated luminosity

►  $\sigma_{pp \rightarrow b\bar{b}}$ :  $pp \rightarrow b\bar{b}$  cross section

►  $f_q$ : hadronisation fraction

→ Large uncertainties

► Analysis steps:

**1. Selection**

→ Two-stage Boosted Decision Tree (BDT) selection

**2. Corrections** of simulation/data differences

**3. Efficiency** calculation

**4. Mass fit** (in bins of the BDT output)

→ **Branching Fraction (BF)** extraction

## Normalised BF measurement

$$\mathcal{B}_{\text{sig}} = \underbrace{\frac{\mathcal{B}_{\text{norm}}}{N_{\text{norm}}}}_{:=\alpha_s(B_s^0 \rightarrow \mu^+ \mu^-)} \times \underbrace{\frac{\varepsilon_{\text{norm}}}{\varepsilon_{\text{sig}}}}_{:=\alpha_d(B^0 \rightarrow \mu^+ \mu^-)} \times \frac{f_d}{f_s} \times N_{\text{sig}}$$

► Normalisation channel:  $B^0 \rightarrow K^+ \pi^-$

→ Similar topology

→ Well-measured BF

► Use  $B^+ \rightarrow J/\psi(\rightarrow \mu^+ \mu^-) K^+$  for validation/cross-check

# The LHCb detector

- ▶ One of four large experiments at the LHC (CERN)
- ▶ Single-arm forward spectrometer
  - Coverage only in the forward region (and one direction)
  - Design choice motivated by  $b$  production in  $pp$  collisions

[JINST 19 (2024), P05065]

## Upgrade 1

- ▶ Detector received a major upgrade after Run 2
- ▶ 5x larger instantaneous luminosity
- ▶ Renewed most detector parts
- ▶ Full detector readout thanks to full software trigger

[JINST 19 (2024), P05065]

## Upgrade 1

- ▶ Detector received a major upgrade after Run 2
- ▶ 5x larger instantaneous luminosity
- ▶ Renewed most detector parts
- ▶ Full detector readout thanks to full software trigger
- **Huge opportunity but also many new challenges**

[JINST 19 (2024), P05065]

# Analysis

- ▶ Dataset collected in 2024 & 2025 at  $\sqrt{s} = 13.6 \text{ TeV}/c^2$
- ▶ Only “good” quality data used
- ▶ 2024 Split in “blocks” with different conditions
- ▶ Total luminosity  $\approx 18 \text{ fb}^{-1}$
- ▶ Suboptimal alignment in early 2024
  - Offline calibrations performed
  - Mass resolution similar to previous detector

- ▶ Mass resolution from  $\mu\mu$  resonances

Before calibration/refitting

- ▶ Dataset collected in 2024 & 2025 at  $\sqrt{s} = 13.6 \text{ TeV}/c^2$
- ▶ Only “good” quality data used
- ▶ 2024 Split in “blocks” with different conditions
- ▶ Total luminosity  $\approx 18 \text{ fb}^{-1}$
- ▶ Suboptimal alignment in early 2024
  - Offline calibrations performed
  - Mass resolution similar to previous detector

- ▶ Mass resolution from  $\mu\mu$  resonances

After calibration/refitting

- Dataset dominated by random combination of tracks (“combinatorial”)

- ▶ Dataset dominated by random combination of tracks (“combinatorial”)
- ▶ Physical backgrounds:
  - ▶ Semi leptonic  $X_b$  decays with misidentified hadron  $h$
  - ▶ Partially reconstructed decays
  - ▶ Double-misidentified  $B_{(s)}^0 \rightarrow h^+ h'^-$  decays

Run 2 fit [Phys. Rev. Lett. 128 (2022), 041801]

## 1. Trigger selection not relying on muonic trigger

→ Good alignment between  $B_{(s)}^0 \rightarrow \mu^+ \mu^-$  signal and  $B_{(s)}^0 \rightarrow h^+ h'^-$

## 2. Cut-based selection

→ Displacement from primary vertex, good vertex/track reconstruction, ...

## 3. BDT selection

→ Multiple BDTs employed

## 4. Particle IDentification (PID)

→ Different PID depending on final state

► Selection aligned between signal and normalisation/control modes as much as possible

## First BDT “BDTS”:

- ▶ Based on candidate-level information
- ▶ Loose selection for initial suppression of combinatorial background

## First BDT “BDTS”:

- ▶ Based on candidate-level information
  - ▶ Loose selection for initial suppression of combinatorial background
- 

## Track isolation BDTS:

- ▶ Exploiting full event information
- ▶ Quantify isolation of signal w.r.t other tracks
- ▶ Derive candidate-level features from this

## Second BDT “Global BDT”:

- Uses track isolation as input
- Optimised in dependence on BDTS
- Output transformed to be uniform for signal  
→ Final fit in bins of this output

## Second BDT “Global BDT”:

- Uses track isolation as input
- Optimised in dependence on BDTS
- Output transformed to be uniform for signal  
→ Final fit in bins of this output

- ▶ Simulation is imperfect due to
  - Complex detector response, time dependent effects, limited precision ...
- ▶ Have to correct/calibrate these effects

## Corrections:

### 1. Decay kinematics and multiplicity

- Correct using **GradientBoostedReweighters** (GBRs)
- Train GBRs to reweight simulation to match sWeighted control-mode data

- ▶ Simulation is imperfect due to
  - Complex detector response, time dependent effects, limited precision ...
- ▶ Have to correct/calibrate these effects

## Corrections:

1. Decay kinematics and multiplicity
2. Tracking efficiency and hadronic interaction corrections
  - Apply data/simulation correction maps calibrated from different decay channels

- ▶ Simulation is imperfect due to
  - Complex detector response, time dependent effects, limited precision ...
- ▶ Have to correct/calibrate these effects

## Corrections:

1. Decay kinematics and multiplicity
2. Tracking efficiency and hadronic interaction corrections
3. Trigger efficiency
  - Calibrate trigger efficiency on data

- ▶ Simulation is imperfect due to
  - Complex detector response, time dependent effects, limited precision ...
- ▶ Have to correct/calibrate these effects

## Corrections:

1. Decay kinematics and multiplicity
2. Tracking efficiency and hadronic interaction corrections
3. Trigger efficiency
  - Calibrate trigger efficiency on data
4. PID efficiency
  - Apply per-event PID efficiencies from data

- Cross-checks required to validate the method and exclude potential errors

## 1. Absolute and normalised branching fraction measurements on $B_{(s)}^0 \rightarrow h^+ h'^-$

### Absolute Branching Fractions

- Cross-checks required to validate the method and exclude potential errors

## 1. Absolute and normalised branching fraction measurements on $B_{(s)}^0 \rightarrow h^+ h'^-$

### Normalised Branching Fractions

- Cross-checks required to validate the method and exclude potential errors
- 1. Absolute and normalised branching fraction measurements on  $B_{(s)}^0 \rightarrow h^+ h'^-$
- 2. Ratio of  $B^0 \rightarrow K^+ \pi^-$  over  $B^+ \rightarrow J/\psi K^+$

# Results

- Perform a blinded fit and overlay expected signal model
- Fit simultaneous in BDT bins

- ▶ Perform a blinded fit and overlay expected signal model
- ▶ Fit simultaneous in BDT bins
- ▶ Blinded fit looks very promising
  - Very low background in highest BDT bins
- ▶ Expected precision scales well with the luminosity (compared to previous measurement)
- ▶ Sensitivity for  $B^0 \rightarrow \mu^+ \mu^-$  is being studied with pseudo experiments
  - Good chance for evidence
  - Still statistically limited

# Conclusion

- ▶  $B_{(s)}^0 \rightarrow \mu^+ \mu^-$  decays provide sensitive tests of the Standard Model and offer a rich physics programme
- ▶ Long history of measurements established these decays as an important probe of the SM
- ▶ One of the first major analyses with LHCb Upgrade 1 detector
  - With the new dataset we are getting closer to finding evidence for  $B^0 \rightarrow \mu^+ \mu^-$
- ▶ Large and complex analysis involving many different aspects and contributions from a large team
  - ▶ Only shown a small part today
- ▶ Analysis well on track → working on the last finalisations

Backup

►  $\mathcal{A}_{\Delta\Gamma}$

$$\mathcal{A}_{\Delta\Gamma} = \frac{1}{y_s} \frac{(1 - y_s^2)\tau_{\mu\mu} - (1 + y_s^2)\tau_{B_s^0}}{2\tau_{B_s^0} - (1 - y_s^2)\tau_{\mu\mu}}, \quad \text{with} \quad y_s = \frac{\Delta\Gamma}{2\Gamma_s}$$

►  $S_{\mu\mu}$

$$\frac{\Gamma(B_s^0(t) \rightarrow \mu^+\mu^-) - \Gamma(\bar{B}_s^0(t) \rightarrow \mu^+\mu^-)}{\Gamma(B_s^0(t) \rightarrow \mu^+\mu^-) + \Gamma(\bar{B}_s^0(t) \rightarrow \mu^+\mu^-)} = \frac{S_{\mu\mu} \sin(\Delta Mt)}{\cosh\left(\frac{y_s t}{\tau_{B_s^0}}\right) + A_{\Delta\Gamma}^{\mu\mu} \sinh\left(\frac{y_s t}{\tau_{B_s^0}}\right)}$$
